Introduction: Nausea and vomiting are seen in 50% to 90% of pregnant women in first trimester. Severe nausea and vomiting associated with weight loss and electrolyte imbalance in pregnancy is called hyperemesis gravidarum (HG). Its cause is unknown but there are some hypotheses like hormonal mechanisms, psychological and emotional factors other such as helicobacter pylori infection. In addition many studies were done for evaluation of anti nausea and vomiting effect of drugs for hyperemesis gravidarum control in pregnant women. The aim of this study was comparative efficacy of ondansetron with metoclopramide and vitamin B6 in treatment of pregnancy nausea and vomiting.

Methods: In a clinical trial study 129 pregnant women with hyperemesis gravidarum were selected and randomly divided in 3 groups. The first, second and third groups were treated by vitamin B6, metoclopramide and ondansetron oral tablets. Women with hyperemesis gravidarum were selected in Dr Sharif pregnant women were tablet in a day respo measured after 1 week as age, sex, BMI and entered to computer square ANOVA and Tukey.

Results: The vomit metoclopramide and respectively and the significant (P<0.001).

Conclusion: All study gravidarum control b pregnant women ha pregnancy can presc.

Key words: hyperemesis, ondansetron.
